Trading Strategy: US Equity Index Futures & Options

Program Description: The Dynamic S&P Options Strategy primarily trades US equity index futures and options on their futures contracts. The strategy is designed to capture the decay of option premiums. The program sells deep out of the money options. Option contracts are written at a sufficient distance, to allow in most cases, for the options to expire worthless. Primarily uncovered or naked options are sold (although spreads are utilized at times). The program may trade index futures for hedging or speculative purposes. The program may also trade index futures directly. The trading strategy is mostly discretionary. Both fundamental and technical analysis is incorporated into the trading decision. One of the main differences to the Stock Index Writing Strategy is the shorter time period of the options till expiration.

It is computed by applying successively respective monthly rate of return for each month beginning with the first month of that period. It smooths out the returns by assuming a constant growth.
2. Peak to Valley Drawdown = worst % loss between Jan-2021 and May-2026
3. Sharpe Ratio is calculated using a Risk-Free ROR
4. Sortino Ratio is calculated using a Minimum Acceptable ROR
5. Calmar Ratio uses the last 36 months of data
6. Sterling Ratio uses the last 36 months of data
7. VAMI = Hypothetical growth of \$1,000
8. Drawdown/recovery: start = first loss, recovery = full return to prior peak
